

A Neutral Presentation Template

Clear structure, low density, easy to read

This template keeps PDF slide decks readable

A starting point for building self-contained PDF slide decks.

- Neutral palette and typography for any topic
- One idea per slide, generous whitespace
- Built on Beamer with the Metropolis base theme

One idea per slide keeps reading easy

A level-one heading creates a section page

Use a level-1 heading to create a section page.

The Metropolis `sectionpage=progressbar` option draws a progress bar above the section title.

A minimal readable default needs no branding

A minimal, readable default with no branding:

- Off-white canvas, dark text, teal structure, terracotta alerts
- Source Sans for text, Source Code Pro for monospace
- Circle bullets in light gray, transparent blocks

Bullet lists nest without shrinking

Bullet lists use light-gray circle markers:

- First point states the main idea
- Second point adds supporting detail
 - Nested points keep the same size as the parent
 - No shrinking at deeper levels
- Third point closes the set

Keep each list to three to five items.

Numbered lists show sequences in order

For sequences and steps:

1. Define the question or goal
2. Collect and check the evidence
3. Analyse and compare alternatives
4. Summarise the outcome

Numbered lists work well for methods and timelines.

Emphasis marks key terms and alerts draw attention

Regular emphasis uses *italic* or **bold**.

Alerted text combines bold and color: critical value.

Use alerts sparingly, one per slide at most.

i Quarto callout

In Beamer this renders as a transparent block with a teal title.

Use callouts for definitions, notes, or takeaways.

Translucent blocks carry teal headings

Block title

Blocks are transparent by design. The title appears in teal and the body inherits the normal text color.

Use blocks to group a definition, example, or summary without adding visual weight.

Two columns sit side by side

Left column

- Compact point
- Another point
- Keeps text scannable

Right column

- Parallel point
- Supporting detail
- Balanced whitespace

Columns help you place text beside a figure, table, or list.

Small tables with captions compare cleanly

Table 1: A minimal table with a caption

Method	Sample	Accuracy
A	120	0.82
B	120	0.87
C	120	0.91

Keep tables small. For larger data, split across slides or move details to an appendix.

Code blocks render without running anything

The example below computes the mean of four numbers.

```
def mean(values):  
    return sum(values) / len(values)  
  
mean([2, 4, 6, 8])
```

Equations need plain-language definitions

In $y = mx + c$, m is the slope and c is the starting value. The longer equation below shows a prediction made from an intercept, coefficients, inputs, and an error term.

$$\hat{y} = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \epsilon$$

Equations use the Beamer math fonts and respect the surrounding text size.

**Extra material belongs after the main
story**

A new deck starts by replacing this example

- Copy `template.qmd` to begin a new talk
- Replace title, author, and section headings
- Keep one idea per slide
