What this template is

A starting point for building self-contained PDF slide decks.

- Neutral palette and typography for any topic
- One idea per slide, generous whitespace
- Built on Beamer with the Metropolis base theme

Layout

How section pages work

Use a level-1 heading to create a section page.

The Metropolis `sectionpage=progressbar` option draws a progress bar above the section title.

A minimal, readable default with no branding:

- Off-white canvas, dark text, teal structure, terracotta alerts
- Source Sans for text, Source Code Pro for monospace
- Circle bullets in light gray, transparent blocks

Bullet lists use light-gray circle markers:

- First point states the main idea
- Second point adds supporting detail
 - Nested points keep the same size as the parent
 - No shrinking at deeper levels
- Third point closes the set

Keep each list to three to five items.

Numbered lists

For sequences and steps:

1. Define the question or goal
2. Collect and check the evidence
3. Analyse and compare alternatives
4. Summarise the outcome

Numbered lists work well for methods and timelines.

Emphasis and alert

Regular emphasis uses *italic* or **bold**.

Alerted text combines bold and color: critical value.

Use alerts sparingly, one per slide at most.

i Quarto callout

In Beamer this renders as a transparent block with a teal title.

Use callouts for definitions, notes, or takeaways.

Block title

Blocks are transparent by design. The title appears in teal and the body inherits the normal text color.

Use blocks to group a definition, example, or summary without adding visual weight.

Left column

- Compact point
- Another point
- Keeps text scannable

Right column

- Parallel point
- Supporting detail
- Balanced whitespace

Columns help you place text beside a figure, table, or list.

Table 1: A minimal table with a caption

Method	Sample	Accuracy
A	120	0.82
B	120	0.87
C	120	0.91

Keep tables small. For larger data, split across slides or move details to an appendix.

Code uses Source Code Pro (or Latin Modern Mono as fallback).

A fenced code block renders without needing a Jupyter kernel:

```
def mean(values):  
    return sum(values) / len(values)  
  
mean([2, 4, 6, 8])
```

Inline math: $y = mx + c$. Display math:

$$\hat{y} = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \epsilon$$

Equations use the Beamer math fonts and respect the surrounding text size.

Appendix

Start a new deck from here

- Copy `template.qmd` to begin a new talk
- Replace title, author, and section headings
- Keep one idea per slide
